Job-Market Paper

“Precautionary saving, wage risk, and cyclical reallocation”

Abstract: Workers, along with the risk of unemployment, face the wage risk coming from employment-employment reallocation. I examine the consequences of cyclical wage risk variation within a model incorporating search and matching frictions, incomplete markets, and nominal rigidities. In this economy, endogenous countercyclical wage risk can trigger a significant destabilizing demand feedback driven by a precautionary saving motive. I demonstrate that a dynamic job ladder amplifies the response to productivity shocks through changes in the reallocation rate and cyclical variations in relative wages. I argue that both channels are empirically plausible.
